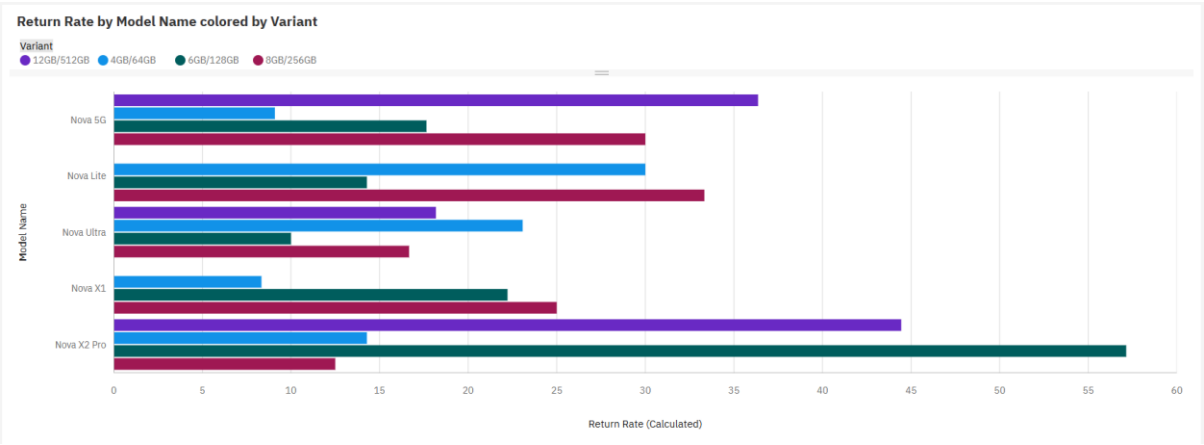
Question 4:

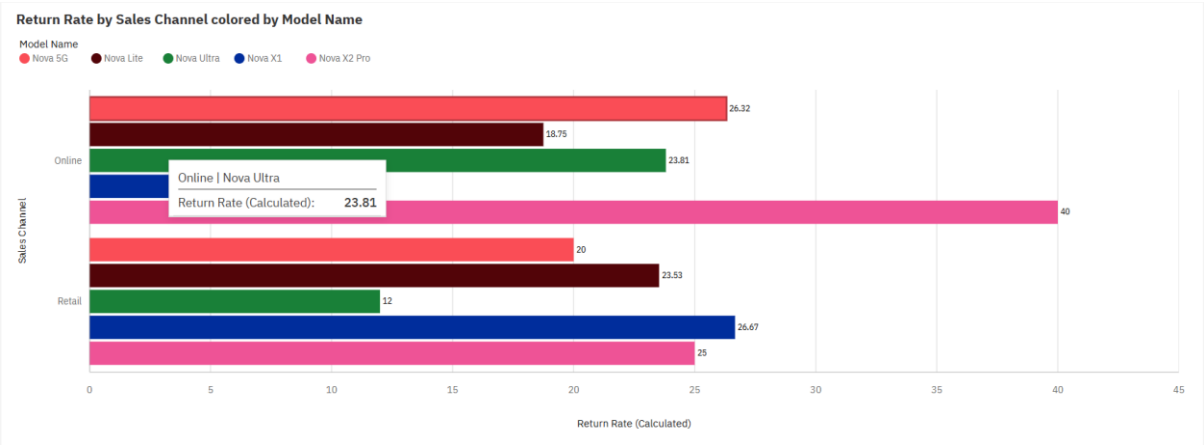
Using Cognos Exploration, analyze the NovaTech dataset to discover which Model and Variant combination has the highest return rate and why. Explore whether Sales Channel (Retail vs Online) influences return behavior. Also explore how Customer Satisfaction Score correlates with Resolution Time. Document findings with annotated visuals.

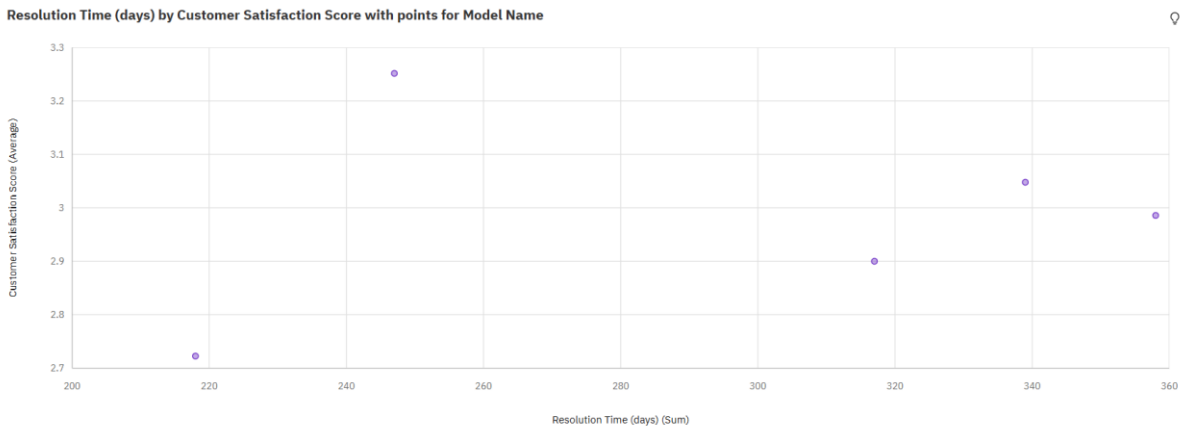
Objective:

To analyze return rates, sales channel impact, and the relationship between resolution time and customer satisfaction using Cognos Exploration.

Steps Performed:

- Open Cognos Analytics → Exploration and upload the dataset.
- Add Model Name and Variant to analyze product-wise data.
- Create a calculation for Return Rate = (Returns / Units Sold) × 100.
- Sort the data to find the highest return rate model and variant.
- Add Return Reason and create a chart to identify main causes of returns.
- Add Sales Channel (Retail vs Online) and compare return rates using a bar chart.
- Create a scatter plot with Resolution Time and Customer Satisfaction Score to check correlation.
- Add filters (Model, Region, Channel) and include annotations to highlight key findings.






Final Output:
